

ServiceNow Lab Documentation

Lab: Script-Controlled ACL – Restrict Record Access Based on Field Value

Duration: 3 Hours

Description

This lab demonstrates how to implement a script-controlled Access Control List (ACL) to restrict users from viewing records unless they meet specific conditions. In this scenario, only users belonging to the EEE branch are allowed to view records where the Branch field is set to EEE, while administrators retain full access.

Milestone-1: Creation of Users and Roles (Phase 1)

1. User Creation Instructions

Log in to the ServiceNow instance with **admin** access.

Navigate to **User Administration** → **Users** in the application navigator.

Click the **New** button at the top of the list view.

Fill out the User form with the following exact details:

- **User ID:** EEE User
- **First name:** EEE
- **Last name:** User
- **Email:** eeeuser@gmail.com

Click **Submit** or right-click the header bar and select **Save** to store the user record.

2. Role Creation Instructions

Navigate to **User Administration** → **Roles**.

Click the **New** button.

Configure the first custom role:

- **Name:** bb1
- **Description:** Role for EEE Branch assignment validation.

Click **Submit** to save the role.

Repeat the exact same procedure to create the remaining roles: **bb2**, **bb3**, and **bb4**.

3. Role Assignment Instructions

Navigate back to **User Administration** → **Users** and search for the user record with User ID **EEE User**.

Click to open the user record form.

Scroll down to the **Roles** related list at the bottom of the page.

Click the **Edit...** button.

Use the collection slushbucket search tool to locate the created roles (**bb1, bb2, bb3, bb4**).

Select and move all four roles to the right-hand column (**Roles List**).

Click **Save** to apply the changes.
