

Phase 2: Tables & Fields Creation

Lab Scenario: Script-Controlled ACL – Restrict Record Access Based on Field Value

Milestone-2: Creation of Tables and Fields

In this milestone, you will create the custom application table and configure its schema including field names, types, and choice values.

Step 1: Create the Custom Table

- Log in to your ServiceNow instance with admin privileges.
- In the **Application Navigator**, search for **System Definition** → **Tables**.
- Click the **New** button to open the table creation form.
- Configure the table header details precisely as specified below:

Field/Property	Value / Configuration Setting
Label	Institution Details
Name	u_institution_details
Extends table	None / false (Leave unchecked)
Create module	True (Checked by default to verify layout)

- Click **Submit** to save and compile the database table definition.

Step 2: Add Fields to the Table

Re-open or stay on the newly created table record (u_institution_details) and add the following database fields via the **Columns** related list or Form Designer:

Field Label	Type	Details / Specific Configurations
Student Roll Number	Auto Number	Prefix: INST (or preferred), Starting Number: 1000
Student Name	Reference	Reference table: User [sys_user]
Faculty Name	Reference	Reference table: User [sys_user]
Branch	Choice	Add choices: ECE, EEE, CSE

Email	String	Max length: 100
Phone Number	String	Max length: 40
Description	Multi Line String	Max length: 4000

Step 3: Save Table Schema

- After defining all fields, click **Save** or **Update** to finalize your data model changes.
- Verify that the new fields are accurately populated in the form layout by clicking on **Show Form** under Related Links.
