

ServiceNow Lab Framework

Phase 5: Impersonation Testing, Verification & Create ACL Setup

1. Impersonation & Security Rule Validation

To ensure your Script-Controlled Read Access Control List (ACL) functions correctly according to security requirements, follow these verification steps:

- **Impersonate EEE User:** Navigate to your profile avatar in the upper right corner, click **Impersonate User**, and search for **EEE User**.
- **Access Table Records:** In the Application Navigator's 'All' menu search bar, type `u_institution_details.list` (or `u_institution_details.LIST` to open in a new tab) and press Enter.
- **Verify EEE Visibility:** Confirm that the user with the **bb1** role can strictly view records where the *Branch* field is exactly set to **EEE**. Alternate branches (ECE, CSE) must be invisible.
- **End Impersonation:** Click on the user profile banner and select **End Impersonation** to return to your main administrative profile.

2. Core Security Validation Matrix

Verify your Access Control implementation against the following expected behaviors:

User Type / Role Status	Expected Data Access Behavior
User with bb1 role (e.g., EEE User)	Can view only records with Branch set to EEE .
User without custom role	Cannot view any records in the table (Access Denied).
Admin User	Retains full root access; can view all records regardless of Branch status.

3. Creation of Record Level Create ACL

Next, establish record creation authorization rules to restrict row insertion rights to designated roles:

1. Ensure your profile session still retains elevated **security_admin** privileges.
2. Navigate to **System Security** → **Access Control (ACL)** via the main navigation filter.
3. Click the **New** button at the top of the interface list view.

4. Configure the form field properties with the following technical entries:

```
Type: record
Operation: create
Name: Institution Details [u_institution_details] -- None
Active: true
Advanced: false (Unchecked)
```

5. Scroll down to the **Requires role** related list at the base of the form.
6. Double-click the role selection area or click **Insert a new row...**, then look up and append your custom role: **bb2**.
7. *Note: Do not append any Data conditions or script blocks to this creation rule.*
8. Click the **Submit** or **Save** button to commit the ACL record securely to the engine database.
